

Aluminium is fully recyclable

and the benefits of its recycling are clear

- **Aluminium is fully recyclable without loss of quality**, it keeps the same properties after recycling and cannot be distinguished from virgin material.

- **The energy required to recycle aluminium is about 5% of that needed for primary production** and the amount of energy saved (95%) corresponds with an equivalent saving of greenhouse gases.

- **The benefits are not only environmental, they are also economic.** The value of aluminium material pays for its recycling.

- When available for recycling, aluminium scraps are **recycled into new aluminium applications.**
